

Filtering Canadian Institute for Health Information hospitalization data, using Google Sheets

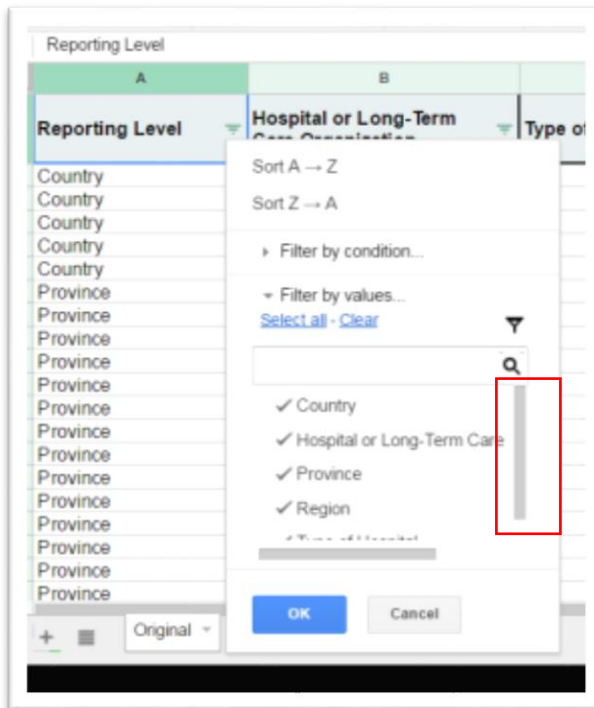

1. You'll find the Ottawa Citizen's story about the dataset by clicking [here](#). For this tutorial, you will have the option of using Google's spreadsheet, or Excel.
2. The 77,000 number the reporter uses in the lead, is taken directly from the institute's [news release](#).
3. Before figuring out if there's a better number we can use for a stronger story, let's determine the origin of the 77,000 hospitalizations caused by heart attacks.
4. The institute initially refused to release the dataset on which its findings are based, but eventually relented, agreeing to provide the data in Excel format, which can be downloaded by clicking [here](#).
5. After reducing the table's size, it was uploaded to [Google Sheets](#). If you can open the file in Excel, then use it to complete the rest of the tutorial. If not, then use the smaller dataset uploaded to Google Sheets. Pages 55-57 of *The Data Journalist* explains the differences in the interfaces in Google Sheets and Excel, and the circumstances under which each type of spreadsheet is used. The screen grabs in this tutorial are for Google Sheets, though you can also use Excel. The choice is yours.
6. After opening the table in Excel or Google Sheets, take a minute to answer these basic questions: How many rows does it have? Do the columns contain text or numbers. What do the column titles mean? Is there a dictionary or file that contains information about the table? After spending a few minutes, delving into these questions, you're ready to find the number used in the news release and newspaper story.

7. We must first apply the filter. Click your mouse anywhere within the table, and select the Filter, the to the right of the menu across the top that looks like a filter.

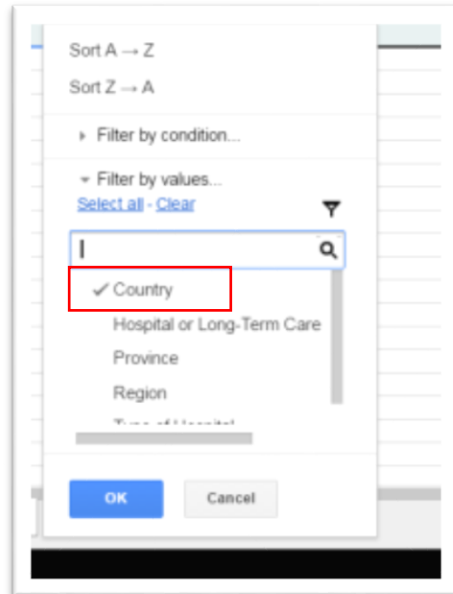

8. You'll see the filters to the right of the column tables.
9. Filters sort textual information in alphabetical order; numbers from smallest to largest. You can use the vertical scroll bar to the right to navigate up and down.

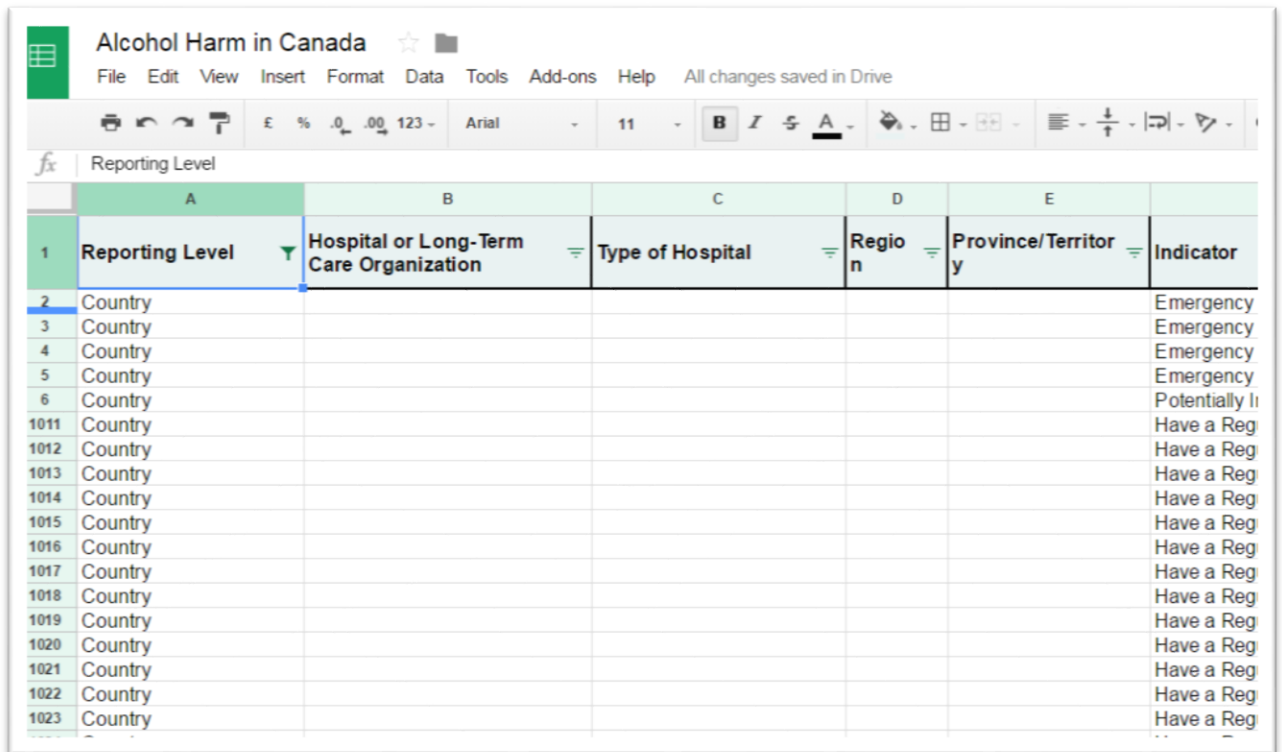

10. Click column A's filter.

11. “Clear” the selection, and click the space to the left of “Country”.

12. Select the “OK” tab.

	A	B	C	D	E	
1	Reporting Level	Hospital or Long-Term Care Organization	Type of Hospital	Region	Province/Territory	Indicator
2	Country					Emergency
3	Country					Emergency
4	Country					Emergency
5	Country					Emergency
6	Country					Potentially I
1011	Country					Have a Reg
1012	Country					Have a Reg
1013	Country					Have a Reg
1014	Country					Have a Reg
1015	Country					Have a Reg
1016	Country					Have a Reg
1017	Country					Have a Reg
1018	Country					Have a Reg
1019	Country					Have a Reg
1020	Country					Have a Reg
1021	Country					Have a Reg
1022	Country					Have a Reg
1023	Country					Have a Reg

13. Use the horizontal scroll bar at the bottom of the table, to navigate to column G (Data Year).
14. Since the story was based on the most recent year for which the data is available, filter for 2015-2016.
15. For column H (), select “All”
16. For Column I (Sex), select “Both”
17. Sort column N (Numerator) in descending order and find the 77,064 number that was used in the story.
18. Now we want to put this table into a new worksheet.
19. Click the plus sign (+) at the bottom left of the table to add a new worksheet.

20. Paste the new table.

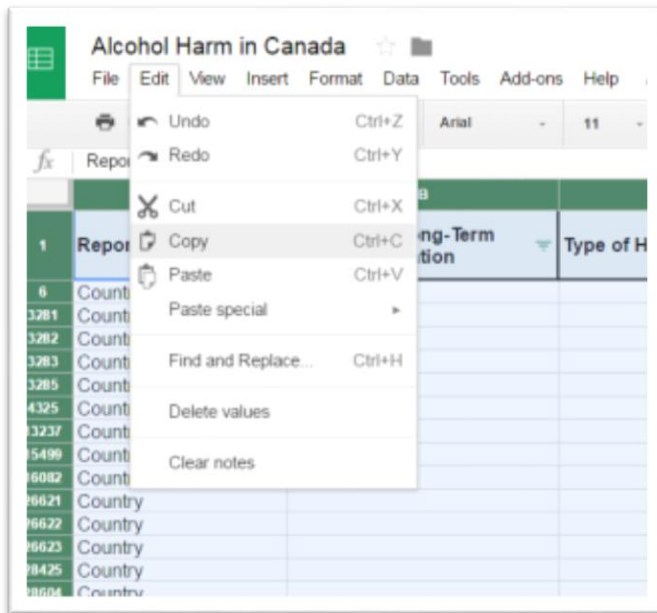

21. Return to the original worksheet and select the table by clicking rectangle between label A in the first column and the number 1, indicating the first row.

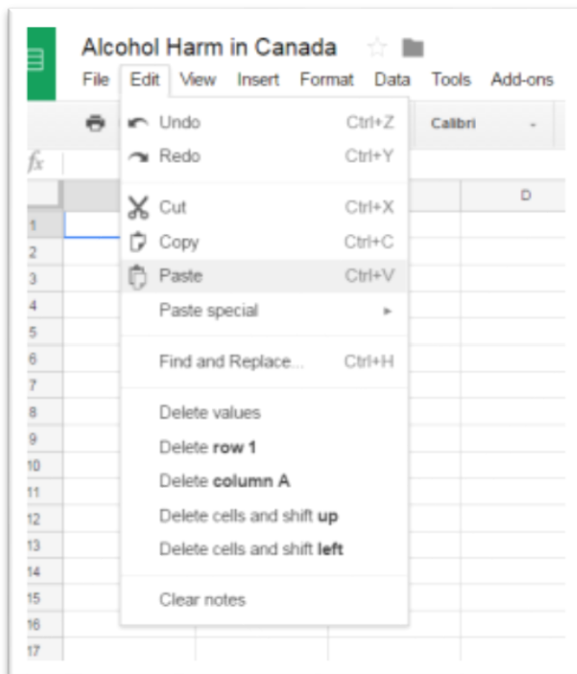

A screenshot of the same Google Sheets interface. The table is now visible, starting from row 1. The first row (row 1) contains headers: "Reporting Level" in column A, "Hospital or Long-Term Care Organization" in column B, and "Type of" in column C. The subsequent rows (rows 2-11) contain data, with the first column (column A) listing various "Country" entries. The table is highlighted with a light blue background.

17	Country					Hospital Deaths Following Major Surgery
18	Country					Low-Risk Caesarean Sections

30. If the information in this row formed the basis of your story, you might want to highlight it by clicking on “Format” on the menu above the table.

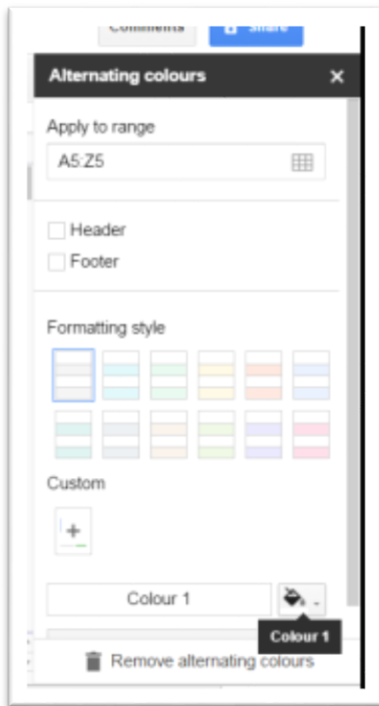

The screenshot shows a Google Sheets interface with a table titled "Alcohol Harm in Canada". The table has columns: Reporting Level, Hospital or Long-Term Care Organization, Type of Hospital, Region, Province/Territory, and Indicator. Row 5 is highlighted. The "Format" menu is open, showing options like Bold, Italic, Underline, Strike-through, Align, Merge cells, Text wrapping, Text rotation, Conditional formatting..., Alternating colours... (highlighted with a red box), and Clear formatting. The bottom status bar shows "Original" and "HeartAttacks" tabs.

31. Select “Alternating colours”.

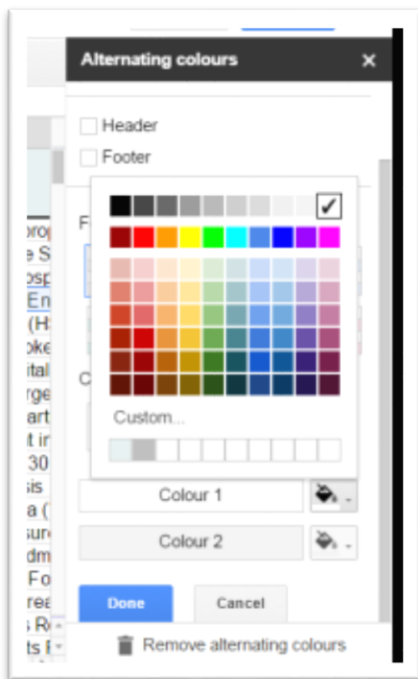

32. In the “Alternating colours” dialogue box, you’ll notice that all the cells in the row, or the “range”, is identified with the cell references A5 to Z5. For those using Excel, you can simply right-click to obtain the short-cut menu and select the colour that you want.

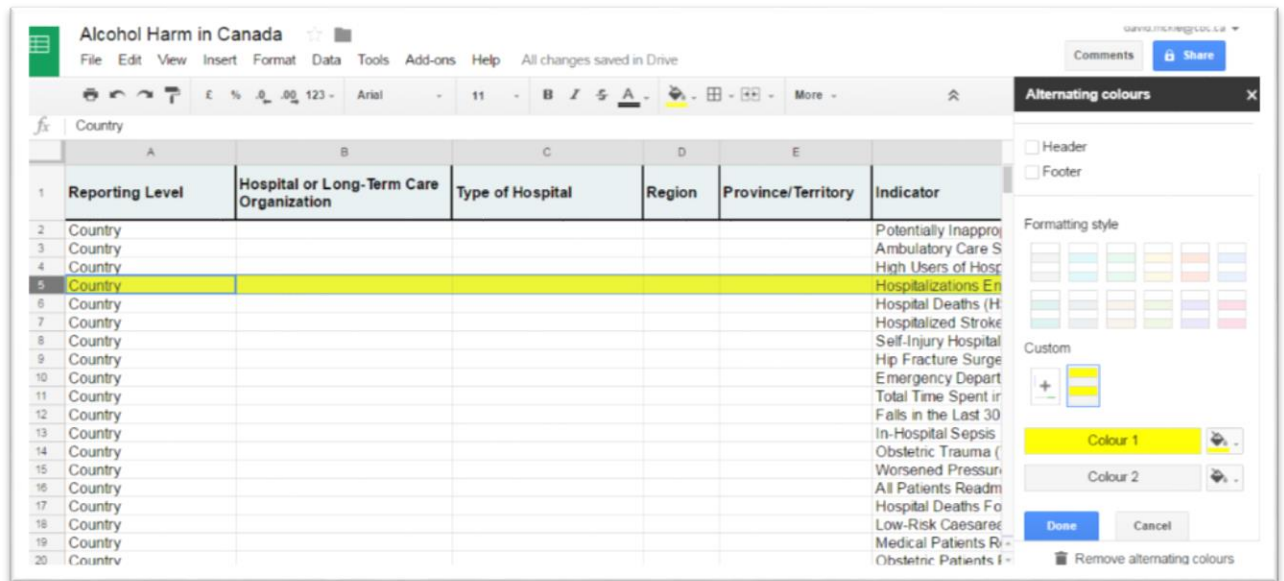

33. Uncheck the box to the left of “Header”.

34. Click the arrow next to the icon to the right of the “Colour 1” section.

35. Choose a colour from the palette, let's say yellow.

36. If you're satisfied with the selection, click "Done" to return to the table.

37. Close the "Alternating colours" dialogue box.

38. Take a minute to study the new table, especially the categories rows 2-4. These also look serious, and might be worth taking a closer look by returning to the original worksheet and filtering the

data for categories such those in column H, the Socio-Economic Status, or “Sex” to see if the results are more serious for males of females. Or you might be interested in other categories in column F, “Indicator.” All of a sudden, you are in charge. So, instead of being guided by a news release, you’re in a position to make different – and possibly better -- choices using the institution’s own data.

39. At the beginning of this tutorial, we mentioned the importance of reading documentation such as data dictionaries, or “readme” files that help explain the numbers like [these notations](#) that I’ve made in the report uploaded to DocumentCloud.
