

Your best bet is to use GPS Visualizer for this task.

- 1) Go here - <http://www.gpsvisualizer.com/geocoding.html>
- 2) Select the Option “2”, Geocode multiple addresses
- 3) Now you’ll have to decide which source you’ll be using to Geocode (MapQuest Open, Bing Maps or Google). Since you’re geocoding more than 5 points, you’ll have to get an api key. We’ve used Bing Maps in the past with success. Once you’ve selected which source, click on “Get a Key” to get the API key for that particular source.
- 4) Once you’ve gotten the api key, copy and paste the content from your excel file to the input section.
- 5) Change the source to whichever key you got. In this example, we’ll use “Bing Maps”
- 6) Click on start geocoding.
- 7) Once the results are done, copy and paste them back into Excel.
